

There are many kinds of toilets and **Toiee® Toilet Plug** can block most U-bends in the above-mentioned way.

But if blocking the U-bend is not successful, then do the following instead.

Place the hose so that the blue marker ring is on the edge of the toilet. Keep a solid hold on the safety cord and the hose just in front of the pump and press the big flush button. In this way, the Toilet Plug will slide in and be placed all the way at the back in the drain of the U-bend. The hose must be under the toilet seat and be tight. The blue marker ring must be on the edge of the toilet, about 14 cm from the pump. Tie the safety cord securely to the toilet seat.

Fill the toilet bowl as described above. Put the toilet lid down on the toilet seat.

Leave the solution to work as described above.

After treatment:

When pulling out the Toilet Plug, it may feel as if it is stuck. This is because the balloon is far back in the U-bend. Carefully pull on the safety cord. It is securely fixed to the Toilet Plug. Pull with the one hand and help the hose out through the U-bend with the other hand.

Toiee® Toilet Plug

Get a shiny clean toilet - without limescale and ochre

Useful information and user instructions

The first time Toiee® Toilet Plug is used

When the Toilet Plug is used for the first time, there may be sharp limescale deposits in the U-bend, which may damage Toilet Plug. Therefore, our recommendation is to fill the U-bend with hot water and 1/4 litre **Toiee® Special Toilet Cleaner**, or 1/4 litre **Toiee® Special Toilet Descaler Extra Power**. Leave it for a couple of hours or overnight. Brush thoroughly with a toilet brush or by hand wearing rubber gloves. Please note that this is only done with the first use.

Check that the balloon is intact

Check the balloon by pumping it up until it is hard and then placing it in water. If air bubbles escape from the balloon, it is leaking, and the entire Toilet Plug set must be replaced. If there are no air bubbles, then the balloon is intact and can be placed in the toilet.

Fill the toilet bowl up completely

When the toilet bowl is filled completely with **Toiee® Toilet Cleaner** and hot water from the tap, it also cleans under the flushing edge. The flushing edge is otherwise almost impossible to clean. But it is an important place to clean to keep the toilet bowl free of bacteria and limescale deposits. There may be heavy limescale deposits which diminish the flushing effect in the toilet bowl, which may be the reason for the need for even more cleaning.

Use the correct toilet cleaner

Use **Toiee® Special Toilet Cleaner** for thorough cleaning of the toilet when it has dirt and ochre deposits, black streaks, remnants from toilet cleaner, limescale and other deposits. Use **Toiee® Special Toilet Descaler Extra Power** when limescale deposits are especially tough and severe.

Repeat the treatment

If there are still some deposits remaining in the toilet after treatment, then just repeat the treatment. Please be aware that toilet cleaning agents are more effective with hot water from the tap than with cold water.

Environment and the service life of the enamel

Toiee® Toilet Cleaner is safe to use on the toilet bowl enamel and, therefore, helps to extend the service life of the enamel and the toilet. All **Toiee®** cleaning products are biodegradable.

Use Toiee® Toilet Plug regularly

We recommend that you treat your toilet with **Toiee® Toilet Plug** and **Toiee® Toilet Cleaner** every month or every second month. In this way, you can be sure that the toilet is clean, also right up under the flushing edge. If you want to be sure you have a nice and properly clean toilet all the time, use **Toiee® Special Toilet Cleaner** for the daily cleaning. The combination of regular use of the Toilet Plug treatment and daily cleaning with **Toiee® Special Toilet Cleaner**, means a shiny clean toilet every day.

Toiee® Toilet Plug can be used multiple times

The Toilet Plug is a professional tool, developed for the effective cleaning of toilets. Made of natural rubber, the Toilet Plug is very durable and usable in all types of installations. Avoid scratches and

cut marks on the balloon and pump, and the Toilet Plug will last for years. Must be stored in a dark place so the rubber does not perish.

Damaged enamel in the toilet bowl

Toiee® Toilet Cleaner removes most deposits without scrubbing. In those cases where the toilet has previously been exposed to attempts at cleaning with drain cleaner, hydrochloric acid, sanding or scraping tools, the enamel in the toilet is often damaged. Damaged enamel is almost impossible to repair. No cleaning agent can properly clean a toilet with damaged enamel.

Avoid flushing out the Toilet Plug

Place the hose and safety cord between the toilet seat and the toilet bowl. Fasten the safety cord to the toilet seat and put the lid down during the treatment. After the treatment is completed, the Toilet Plug must be removed. Keep a solid hold of the safety cord before the air is let out of the balloon. A strong pull will occur on the safety cord and hose when the water from the completely full toilet bowl is flushed out. Therefore, the air release valve must be carefully pressed.

Black streaks

Black streaks or marks in the toilet have never been observed after treatment with the Toilet Plug, neither during nor after treatment.

The hose is strong and is securely fixed

Even so, the Toilet Plug is fitted with a safety cord. When removing the Toilet Plug from the toilet, carefully pull the safety cord and the hose at the same time. Also, even though the balloon is perhaps a little more stuck than expected.

If accidents happen

No harm is done if the Toilet Plug is flushed down the toilet. If the soft, flat natural rubber balloon is flushed out, it will be flushed all the way out through the drainage system together with other waste. Neither the balloon, pump nor hose can damage the drainage system.

Cleaning

With the thought of what normally goes through a toilet drain, there are rarely traces of this on the Toilet Plug after use. After use, just rinse the Toilet Plug with hot water.

Maintenance and storage

The Toilet Plug is made of natural rubber. To avoid damage during storage, it must be stored in a dark place. Also lubricate it with natural oil or silicone so the rubber does not perish.

Safety

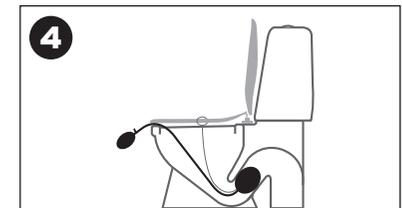

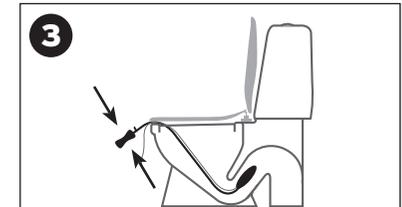

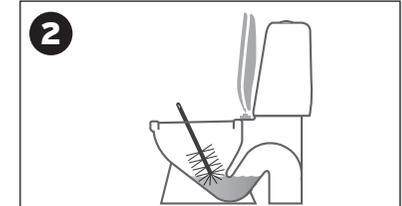

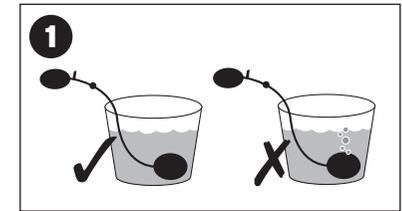

Use rubber gloves, clothing protection and safety glasses.

User instructions:

Use rubber gloves, clothing protection and safety glasses.

1. Check that the Toilet Plug is intact by pumping it up until it is hard and then placing it in water. Check that the safety cord is securely fixed to the Toilet Plug.
2. Push the water out of the toilet bowl with a toilet brush.
3. Place the Toilet Plug as far back in the U-band as possible so the blue marker part on the hose is just visible. Pump up the balloon with the hand pump by pressing 30-40 times and place the hose and safety cord under the toilet seat.
4. Fasten the safety cord to the toilet seat and put the toilet lid down during the treatment.
5. Fill the toilet bowl about half way with hot water from the tap. Before you carry on, you must ensure that the water does not sink. Wait a couple of minutes. When you are certain that the balloon has closed off the U-bend, then add about 1/4 litre **Toiee® Toilet Cleaner**. Then fill the toilet bowl right up to the flushing edge with hot water from the tap.
6. Leave the solution to work for 30 minutes - 2 hours or leave it overnight. Repeat the treatment for particularly tough deposits or leave the solution to work for a longer period.

After the treatment:

1. Keep a solid hold on the safety cord and hose.
2. Lift the toilet seat until it rests on the cistern and keep a solid hold on the safety cord and hose.
3. Carefully press the air release valve.
4. When the water is let out, there may be a strong partial vacuum. Therefore, keep a solid hold on the safety cord and hose.
5. Carefully pull on the safety cord and hose and remove the Toilet Plug from the toilet.
6. Flush the toilet and brush the toilet bowl as usual. Rinse the Toilet Plug with hot water.
